SUMMARY

Full-stack engineer with 5 years building software, most of it in TypeScript, with React on the front end and Node.js and NestJS on the back end. Today I work on the core of Nexa Pulse, a multi-tenant SaaS analytics product, where I build the React application and the NestJS API and run the release process from staging to production. I am also senior engineer on CreditFlow, a credit analysis platform used by several enterprise clients, where I handle features, client tickets and production incidents from diagnosis to fix. On both products I own the AI features too: RAG, semantic search and MCP servers.

Before that I led the rewrite of a legacy Pascal module into a React and Node.js web application, which cut average processing time on its workflows by 70%. I also built and run a Next.js car financing simulator with almost 20,000 users. I like owning a feature from the screen down to the database, and I use coding agents every day, reviewing everything they produce before it ships.

SKILLS

Front-end: TypeScript, JavaScript, React 18/19, Next.js (App Router, Server Components, Route Handlers), Vite, Tailwind CSS, TanStack Query, Zustand, React Router, Recharts, HTML, CSS

Back-end: NestJS, Node.js, Express, REST API design, Prisma, C#, .NET, Go, Python

Data: PostgreSQL (row-level security, multi-tenant isolation), SQL Server, MongoDB, SQLite, schema migrations, query optimization

DevOps and Cloud: Docker, Docker Compose, CI/CD (GitLab CI, Azure DevOps), Linux servers, AWS, Azure, Git

Practices: Code review, automated testing with Vitest, staging-first releases, production troubleshooting and incident response, Agile (Scrum, Kanban)

AI: LLM integration, retrieval-augmented generation (RAG), Model Context Protocol (MCP) servers, daily work with coding agents

EXPERIENCE

CTO and Software Architect (Contract)

Nexa Inteligencia Estrategica | Remote | February 2026 to Present

- Build and maintain the core of Nexa Pulse, a multi-tenant SaaS analytics product: the React and TypeScript web app (Vite, TanStack Query, Zustand, Recharts), the NestJS API and a Go data collector.
- Built the dashboard and reporting screens on top of the NestJS REST API, using TanStack Query for caching and server state.
- Set up the release process: deploys go to staging first, the script checks the live commit through a health endpoint and fails on a mismatch, and production only receives code that was validated in staging. Schema changes ship as versioned migrations.
- Track down production issues by reproducing them in a staging environment that runs on an anonymized copy of production data, then fix and redeploy.
- Implemented tenant isolation with PostgreSQL row-level security, and built a RAG pipeline and an MCP server that give LLM agents permissioned access to platform data.

Senior Software Engineer (Contract)

SIACorp | Remote | October 2025 to Present

- Senior engineer on CreditFlow, a credit analysis and management platform deployed for several enterprise clients and used by credit analysts to support lending decisions.
- Handle client tickets and production incidents across client environments, from diagnosis to fix and a clear written answer to the client.
- Built document extraction from unstructured borrower documents, automated credit policy and limit checks, approval routing by authority level, and the integration with the ERP and accounting systems the teams use.

- Own the AI features behind CreditVision and CreditChat, including retrieval-augmented generation over credit policies and prior analyses, with source citation enforced on every answer.

Mid-Level Fullstack Developer

CCM do Brasil | Campo Largo, Parana, Brazil | June 2024 to October 2025

- Led the migration of the legacy Post-Sales and Service Order module from Pascal to React.js, Node.js and Express, rebuilding every core workflow as a web application and cutting average processing time on those workflows by 70%.
- Designed and shipped an image processing and storage API with automatic compression, and moved the company's media hosting to a new server with no downtime on the live site.
- Delivered event-driven features with Apache Kafka on Azure, deployed through CI/CD pipelines.

Software Developer (Intern to Mid-Level)

MPS Informatica Ltda. | Curitiba, Parana, Brazil | October 2021 to September 2024

- Maintained a C# and ASP.NET integration API handling JSON payloads between systems, and tuned SQL Server procedures and queries, making the ones I optimized up to 60% faster.
- Delivered a database migration end to end, writing Python extraction routines against the legacy system and validating the migrated data.

PROJECTS

Move Brasil Calculator (calculadoramovebrasil.com). Next.js car financing simulator for ride-hailing and taxi drivers, with almost 20,000 users and more than 26,000 simulations. Google sign-in, paid plans, and an admin panel with metrics, sales, user management and email campaigns.

glorific.art, e-commerce platform. Storefront and full admin panel in React 19, Vite, Tailwind CSS and TanStack Query, with a .NET 10 API (Clean Architecture) on PostgreSQL. Google Sign-In, JWT with rotating refresh tokens, and shipping and payment provider integrations.

EARLIER EXPERIENCE

Network and Infrastructure Intern (N3), Grupo Positivo | January 2021 to October 2021. FortiGate firewalls, Cisco switching, VLAN segmentation.

Technical Support Intern (N1), Olimpio Tecnologia | February 2020 to January 2021. ERP support across SQL databases, networking and hardware.

EDUCATION AND LANGUAGES

Postgraduate Certificate (Lato Sensu), Machine Learning, Universidade Catolica do Salvador | January 2026 to January 2027 (in progress)

Bachelor of Computer Science, Universidade Positivo | 2020 to December 2023

Languages: Portuguese (native), English (B2 upper intermediate, conversational)
